TABLE OF CONTENTS

Page

DEFINITIONS AND FORMULAS iv

POPULATION 1
- July 1, 1987 estimates and April 1, 1980 census of population of States 2
- July 1, 1981-86 estimates and April 1, 1980 census of population of Idaho districts and counties 3
- Percent change, 1980-1986, Idaho counties *(map)* 4
- July 1, 1984 estimates of population of Idaho cities 5
- April 1, 1980 census of population by age and sex *(Idaho districts, counties)* 8
- July 1, 1987 estimate of population of Idaho, by age and sex 12

TRENDS AND SUMMARY 13
- Trends of Idaho vital events 13
- Vital statistics, 1978-1987 15
- Summary of 1987 vital statistics *(districts, counties)* 17
- Summary of 1987 infant, fetal, perinatal mortality *(districts, counties)* 18

NATALITY 19
- Live births and rates, 1983-1987 *(districts, counties)* 21
- 1987 Live births: sex and race *(districts, counties)* 22
- 1987 Live births: age of mother *(districts, counties)* 23
- 1987 Live births: attendant at birth *(districts, counties)* 24
- 1987 Live births: place of birth *(districts, counties)* 25
- 1987 Live births: birth and fertility rates *(U.S., Idaho, districts, counties)* 26
- 1987 Live births: live birth order by age of mother 27
- 1987 Live births: age-specific fertility rates *(U.S., Idaho)* 27
- 1987 Live births: trimester prenatal care began *(districts, counties)* 28
- 1987 Live births: education of mother *(districts, counties)* 29
- 1987 Live births: prenatal care by education of mother 30
- 1987 Live births: complications and malformations 30
- 1987 Live births: complications and malformations by prenatal care 31
- 1987 Live births: APGAR scores 31
- 1987 Immature live births: race of mother *(districts, counties)* 32
- 1987 Immature live births: age of mother *(districts, counties)* 33
- 1987 Immature live births: live birth order by age of mother 34
- 1987 Immature live births: age-specific immaturity rates 34
- 1987 Immature live births by weight categories *(districts, counties)* 35
- Out-of-wedlock live births 36
- 1987 Out-of-wedlock live births: race of mother *(districts, counties)* 38
- 1987 Out-of-wedlock live births: age of mother *(districts, counties)* 39
- 1987 Out-of-wedlock live births: live birth order by age of mother 40
- 1987 Out-of-wedlock live births: age-specific ratios 40

MORTALITY 41
- Deaths and rates, 1983-1987 *(districts, counties)* 43
- 1987 Deaths: sex and race *(districts, counties)* 44
- 1987 Deaths: age at death *(districts, counties)* 45
- 1987 Deaths: ten leading causes, by sex *(U.S., Idaho)* 46
- 1987 Deaths: ten leading causes by age group 47
- 1987 Deaths: malignant neoplasms by site 51
- 1987 Deaths: selected causes *(U.S., Idaho, districts, counties)* 52
- 1987 Accidental deaths occurring in Idaho: category by age 54
- Infant mortality *(special report)* 56
- Reported morbidity from selected diseases, 1983-1987 59
- 1987 Reported morbidity from selected diseases *(districts, counties)* 60

Infant, fetal, maternal mortality....62
Infant deaths and rates, 1983-1987 *(districts, counties)*....64
1987 Infant deaths: sex and race *(districts, counties)*....65
1987 Infant deaths: causes of death, neonatal and postneonatal....66
1987 Infant deaths: causes of death *(districts, counties)*....67
1987 Infant deaths: neonatal, postneonatal *(districts, counties)*....68
Stillbirths and ratios, 1983-1987....69
Perinatal deaths and ratios, 1983-1987 *(districts, counties)*....70

INDUCED ABORTION....71
Induced abortions in Idaho, 1979-1987 *(counties)*....71
1987 Induced abortions in Idaho and to Idaho residents *(districts, counties)*....72
1987 Induced abortions to Idaho residents: ratios and race *(districts, counties)*....73
1987 Induced abortions to Idaho residents: age of patient *(districts, counties)*....74
1987 Induced abortions in Idaho: procedure by gestation....75
1987 Induced abortions in Idaho: complications by procedure....75
1987 Induced abortions in Idaho: age of patient by marital status....76
1987 Induced abortions in Idaho: previous abortions, living children....76

MARRIAGE AND DIVORCE....77
Marriages, 1978-1987 *(districts, counties)*....78
1987 Marriages: age of bride by age of groom....79
1987 Marriages: race of bride by race of groom....79
1987 Marriages: age of bride by marital status....80
1987 Marriages: age of groom by marital status....81
Divorces, 1978-1987 *(districts, counties)*....82
1987 Divorces: number of children affected....83
1987 Divorces: legal grounds....84
Divorces, 1985-1987: duration of marriage....85

APPENDIX....87
Appendix A: Vital statistics profile of Idaho by district and county....87
Appendix B: Detailed causes of death by age....94

Printed by
State of Idaho, Department of Administration
Bureau of Printing Services

DEFINITIONS AND FORMULAS

RESIDENCE DATA—data allocated by place of residence of the decedent (deaths), or by place of residence of the child's mother (births, stillbirths).

OCCURRENCE DATA — data allocated by place where event occurred, regardless of the person's place of residence (marriages, divorces).

LIVE BIRTH — a birth that shows any sign of life after delivery.

(CRUDE) BIRTH RATE — number of live births per 1,000 population.

$$\left(\frac{\text{live births}}{\text{population}} \times 1{,}000\right)$$

FERTILITY RATE — number of live births per 1,000 women 15-44 years of age.

$$\left(\frac{\text{live births}}{\text{females 15-44}} \times 1{,}000\right)$$

OUT-OF-WEDLOCK RATIO — number of out-of-wedlock live births per 1,000 live births.

$$\left(\frac{\text{out-of-wedlock live births}}{\text{live births}} \times 1{,}000\right)$$

IMMATURE BIRTH — a live birth weighing less than 2500 grams (5½ pounds or less).

IMMATURE BIRTH RATE — number of immature live births per 1,000 live births.

$$\left(\frac{\text{immature live births}}{\text{live births}} \times 1{,}000\right)$$

STILLBIRTH — a spontaneous fetal death of at least 20 weeks gestation or a weight of at least 350 grams (does not include any induced abortions).

STILLBIRTH RATIO — number of stillbirths per 1,000 live births.

$$\left(\frac{\text{stillbirths}}{\text{live births}} \times 1{,}000\right)$$

INFANT DEATH — death of an infant under one year of age.

INFANT DEATH RATE — number of infant deaths per 1,000 live births.

$$\left(\frac{\text{infant deaths}}{\text{live births}} \times 1{,}000\right)$$

NEONATAL DEATH — death of an infant within the first 27 days of life.

NEONATAL DEATH RATE — number of neonatal deaths per 1,000 live births.

$$\left(\frac{\text{neonatal deaths}}{\text{live births}} \times 1{,}000\right)$$

PERINATAL DEATH — includes stillbirths and deaths to infants within the first six days of life.

PERINATAL DEATH RATIO — number of perinatal deaths per 1,000 live births.

$$\left(\frac{\text{perinatal deaths}}{\text{live births}} \times 1{,}000\right)$$

MATERNAL DEATH — death attributable to complications of pregnancy, childbirth, or the puerperium.

MATERNAL DEATH RATE — number of maternal deaths per 10,000 live births.

$$\left(\frac{\text{maternal deaths}}{\text{live births}} \times 10{,}000\right)$$

(CRUDE) DEATH RATE — number of deaths per 1,000 population.

$$\left(\frac{\text{deaths}}{\text{population}} \times 1{,}000\right)$$

CAUSE-SPECIFIC DEATH RATE — number of deaths from a specific cause per 100,000 population.

$$\left(\frac{\text{deaths from specific cause}}{\text{population}} \times 100{,}000\right)$$

Population '87

POPULATION

Each year, the population estimates for Idaho are made available by the Federal-State Cooperative Program for Local Population Estimates. At press time, however, 1987 county estimates were not yet available. **Therefore, all county vital rates are based on provisional 1986 estimates. The 1987 State provisional estimate is available (998,000) and is used as the basis for State rates.** Included in this section are county estimates for 1981-86, and state estimates for 1987.

Since the 1980 census, Idaho's population has grown by 5.8% to 998,000 (provisional) as of July 1, 1987; however, 1987 marked a decline of 0.4% from the 1986 revised estimate of 1,002,000. The chart on the following page shows that Idaho has been near the median of growth since 1980: Idaho was 20th on the list of fastest growing states. In the Mountain and Pacific regions, only Montana, Oregon and Wyoming have experienced slower rates of increase than has Idaho. Alaska had the highest growth rate (30.7%) in the nation for the same period (1980-87). For the most part, states experiencing the most rapid rate of growth are in the western part of the nation.

In Idaho, the fastest growing area from 1980-86 (county estimates are not yet available for 1987) was District 4 (central Idaho), with a growth rate of 11.1%. District 7 (northeast) and District 5 (south central) increased by 7.8% and 6.6%, respectively, although both declined in 1986. District 2 (north central) has experienced a 0.3% loss since 1980.

At the county level, the fastest growing county was Custer, with a growth rate of 49.7%, although it dropped 17.7% from 1984 to 1986; Blaine County was second with a growth rate of 34.2%. Sixteen counties have lost population since 1980; Camas and Shoshone Counties had the highest rates of loss of -15.4% and -14.8, respectively.

The largest numerical increase occurred in Ada County (20,700), followed by Kootenai and Canyon Counties with increases of 7,700 and 6,400, respectively; Shoshone County lost the most numerically (-2,800).

Also in this issue are July 1, 1987, age and sex estimates for Idaho (Bureau of the Census), and the latest population estimates for Idaho cities as of July 1, 1984. The latter estimates have been made available by the Federal-State Cooperative Program for Local Population Estimates. For the period 1980-84, the cities of Challis and Clayton, both in Custer County, had the highest rates of population gain, 107.3% and 104.7%, respectively. This increase reflects the fact that Custer County as a whole had the highest rate of gain for 1980-86. Three of the four cities experiencing the highest rates of loss are in Shoshone County.

ESTIMATES OF THE RESIDENT POPULATION OF STATES
July 1, 1987
Components of Change Since 1980

(In thousands. Includes Armed Forces residing in each State. Percentages based on 1980 population.)

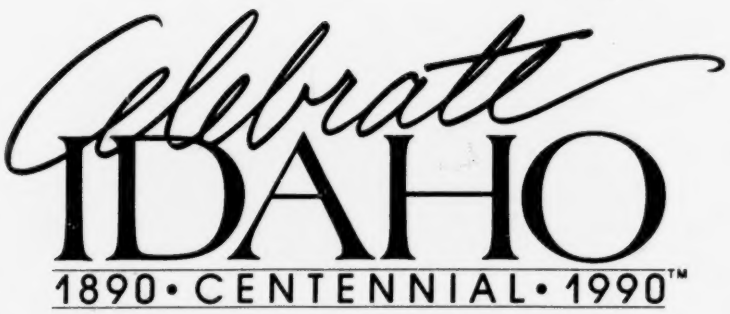
Trends and Summary '87



TRENDS IN IDAHO

BIRTHS ..... Idaho's birth rate continues a remarkable decline: at 16.0 (provisional), it stands at the lowest level ever recorded. The number of births has also declined, and is at its lowest point since 1974, even though the population has grown considerably since then. In 1987, 15,926 births occurred to Idaho mothers, a decrease from 1986 of 3%.

OUT-OF-WEDLOCK BIRTHS ... Out-of-wedlock births continued to increase in 1987: at 2,059 (129.3 per 1,000 live births), it is both the highest ratio and highest number of out-of-wedlock births ever recorded in Idaho. The increase over 1986 data was spread across all age groups. District 3 recorded the highest ratio: at 194.9, it was 51% above the state level.

DEATHS ..... The number of Idaho deaths declined slightly (<1%) in 1987 to 7,305. The rate of death has ceased the downward trend in evidence during the sixties and seventies. It has fluctuated between 7.1 and 7.3 since 1978. In 1987, the death rate was 7.3, the same as in 1986.

STILLBIRTHS ..... Both the number and ratio of stillbirths change little from year to year, although a general decline has been evident over the last several years. In 1987, 95 stillbirths occurred for a ratio of 6.0 per 1,000 live births, a decrease from the 1986 ratio of 6.7.

INFANT DEATHS ..... Infant deaths are also subject to fluctuations because of the small data base. Infant mortality in Idaho declined considerably in the early to mid-70's, but the last several years have seen little overall change. A total of 158 infant deaths occurred in 1987, compared to 186 in 1986. The 1987 rate was 9.9, the third lowest ever recorded. The neonatal death rate was down from 6.8 in 1986 to 5.8 in 1987; postneonatal mortality decreased from 4.6 in 1986 to 4.1 in 1987.

MATERNAL DEATHS ..... One Idaho resident died from complications related to childbirth in 1987 (0.6 per 10,000 live births).

MARRIAGES ..... The number and rate of Idaho marriages declined from 11,957 (11.9) in 1986 to 11,428 (11.5, provisional) in 1987. The number of marriages is still higher than those recorded in the early seventies, but 1987 marks the sixth consecutive year of decline. The rate of marriage is also decreasing, and at 11.5 is at its lowest point in decades.

DIVORCES ..... After seventeen years of annual increases, the number of divorces in Idaho has declined for six straight years. In 1981, a record-high 6,770 divorces were granted, but only 5,892 occurred in 1987. The rate of divorce has also been falling: at 5.9 (provisional) per 1,000 population, it is down slightly from 6.0 in 1986, and is the lowest rate since 1973.

Natality '87

NATALITY

Three percent more infants were born in the United States in 1987 than in 1986. At 3,829,000, this is the highest number of births since 1964. The birth rate of 15.7 was 1% higher than the 1986 rate of 15.5. The fertility rate of 66.1 (the number of births per 1,000 women 15-44 years of age) was 2% higher than in 1986 (64.9). (Both birth and fertility rates for 1987 were the same as in 1985.) According to the National Center for Health Statistics, the increase in the number of live births was due to both a higher fertility rate and a higher number of women in the childbearing ages.

In contrast to the U.S., Idaho experienced a decline in both the number and rate of births in 1987: the number of live births fell an additional 3% (following a 6% decline in 1986 and a 3% decrease in 1985); the birth rate was also down by 3% to 16.0. Since 1979, Idaho's birth rate has declined 27%. Idaho's 1987 provisional fertility rate was 68.6 live births per 1,000 women 15-44 years of age, a 4% decrease from 71.1 (revised) in 1986. In comparison, the 1987 national rate was 66.1. Idaho's birth and fertility rates have historically been much higher than the U.S. rates, but the diminishing difference is remarkable: in 1979, Idaho's fertility rate was 43% higher; in 1987, the difference was only 4%, a fairly rapid and complete turnaround. Likewise, Idaho's crude birth rate at 16.0 is only 2% higher than the U.S.

Birth rates in Idaho in 1987 ranged from 13.0 in Districts 1 and 2 to 19.1 in District 7. Birth rates fell in every district except District 4 which remained unchanged. They do not vary widely in comparison to each other from year to year, in that areas in the northern, southwestern and southern parts of Idaho traditionally experience much lower birth rates than the southeastern areas, but the general trend continues to be downward for all districts.

Three percent of Idaho's 1987 births occurred in a nonhospital setting (the same as 1986), of which 68% were at home. All the remainder of nonhospital births were in physicians' clinics. Home births occurred most frequently in District 4, a change from past years in which Districts 1 and 5 experienced the highest numbers of home births; most of the clinic births were in District 3.

Lay midwives, naturopaths and certified nurse midwives (C.N.M.'s) were the most popular alternatives of those mothers who did not choose a physician-attended birth. The districts vary distinctly in this area, as shown on page 24.

OUT-OF-WEDLOCK BIRTHS

In spite of a 3% decline in total live births, Idaho out-of-wedlock live births increased 6% in 1987 from 1,938 to 2,059 (the increase was spread over all age groups). The ratio of out-of-wedlock births to total births rose 10% from 118.0 to 129.3 per 1,000. Both number and ratio are the highest ever recorded in Idaho. The 1987 out-of-wedlock ratios increased from 1986 for all race groups. During the 1984-1987 period, all but blacks recorded increasing rates (see below).

IDAHO RACE-SPECIFIC RATIOS

	1987	1986	1985	1984	Change 1984-87
White	124.6	113.9	101.7	89.2	+39.7%
Black	176.5	166.7	250.0	189.2	- 6.7
American Indian	395.2	372.4	390.7	352.2	+12.2
Japanese	52.6	50.0	31.3	0.0	N.A.
Other nonwhite	90.9	85.3	72.6	41.7	+118.0
Spanish surname*	199.0	166.3	180.1	132.4	+50.3

The national out-of-wedlock live birth ratio increased in 1985 (the latest data available) to 220.2; this reflects higher ratios for both whites and nonwhites. The U.S. ratio is nearly twice as high as Idaho's, although the differential varies by race: national white ratios are only 16% higher, whereas nonwhite ratios are 94% higher than Idaho's.

	Total	White	Nonwhite		Spanish Surname*
			Total	Black	
U. S. (1985)	220.2	144.7	513.8	601.0	N.A.
Idaho (1987)	129.3	124.6	265.3	176.5	199.0

When comparing U.S. and Idaho ratios, one should keep in mind several influencing factors:

1. Idaho has historically had a higher birth rate than the nation as a whole; since live births provide the base (denominator) for computing out-of-wedlock ratios, the higher the number of births, the lower the ratio. However the differential between the two birth rates is fast diminishing, so this is becoming a lessening factor.
2. Idaho has a small nonwhite population; their higher out-of-wedlock ratios have less effect on the overall ratio.
3. The U.S. ratios shown above lag two years behind Idaho's; undoubtedly the 1987 U.S. ratios will be even higher than in 1985.
4. Idaho has a relatively small data base, so some fluctuation is not unexpected.

District 3 now has the highest out-of-wedlock ratio (194.9), after being second for several years: nearly one out of five infants are out-of-wedlock. District 1 (166.3) and District 5 (131.1) were the next-highest districts. Benewah (234.8), Gem (233.9) and Payette (233.9) Counties had the highest county ratios.

*Included in white totals.

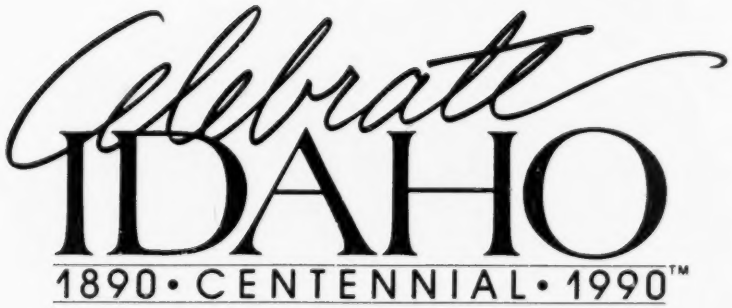
Mortality '87



MORTALITY

After a 3% rise in 1986, Idaho deaths declined very slightly (<1%) in 1987 to 7,305; the rate of death remained unchanged at 7.3 (provisional). No significant changes have been noted since the mid- to late-seventies: Idaho's death rate has ranged from 7.1 to 7.3 since 1978. The U.S. death rate was 8.7 in 1987, unchanged since 1985. Comparing the national death rate with Idaho's reveals that Idaho rates have historically been lower. Age-adjusted rates* show that even allowing for the differing age structures (Idaho's population is younger), Idaho's death rate is below that of the nation.

The five leading causes of death are: (1) Heart disease, (2) Malignant neoplasms, (3) Cerebrovascular disease, (4) Accidents and (5) Chronic obstructive pulmonary disease (COPD). (COPD was not listed as a single cause prior to 1984; it consists of ICD-9 codes 490-496, and includes, but is not limited to, the Bronchitis, emphysema and asthma category previously used.) The leading six causes are the same for both the U.S. and Idaho; the ranking of the next four causes used to be very different, but have become more alike, although some differences still exist, most notably Chronic liver disease and cirrhosis, and Suicide (rates are deaths per 100,000):

Causes ranked 6-10 in U.S.	Rank in Idaho
6. Pneumonia and influenza (28.2)	6 (26.5)
7. Diabetes mellitus (15.5)	8 (14.0)
8. Suicide (12.2)	7 (17.6)
9. Chronic liver disease and cirrhosis (10.7)	13 (5.9)
10. Atherosclerosis (9.5)	9 (8.1)

Of the ten leading causes in the U.S. in 1987, **increases** were recorded in the rates of death from Malignant neoplasms and Chronic obstructive pulmonary disease (COPD). Rates **decreased** for Diseases of heart, and all external causes.

Comparing Idaho's provisional 1987 rates with 1986 rates reveals that of the ten leading Idaho causes of death, **decreased** rates were noted for the four leading causes, while **increased** rates occurred for causes ranked five through ten.

When making comparisons of 1979-1987 mortality data with earlier years, one must be aware that the manner of coding the underlying cause of death changed in 1979 to the ninth revision of the **International Classification of Diseases** (ICD-9). The introduction of ICD-9 in all states has resulted in a major reclassification of several causes of death. Therefore, there are major discontinuities in the trends for certain causes of death. (Comparability ratios between ICDA-8 and ICD-9 have been published in the Vital Statistics Summaries, 1979-1982.)

**To eliminate the bias inherent in differing age compositions (an older population has a higher death rate simply because the risk of dying increases as one ages), age-specific death rates can be calculated. These rates are then applied to a standard population, often the U.S. population, and the composite, or "age-adjusted," death rate is then calculated. Five-year average (1982-1986) death rates have been computed for Idaho counties using the 1940 U.S. Census as the standard population. Data are available upon request.*

(Numbers of deaths in parentheses)

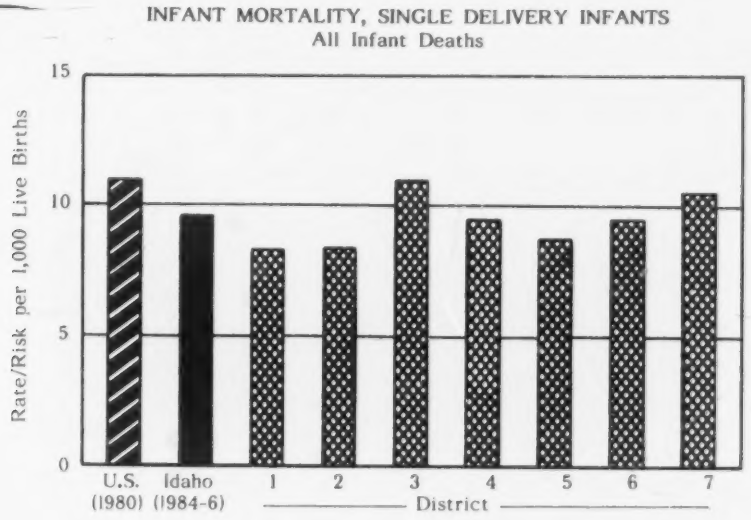
IDAHO INFANT AND PERINATAL MORTALITY STUDY

1986

(The following is a summary of the full report titled above, published in January 1988. A copy of the full report may be obtained from the Cooperative Center for Health Statistics.)

The long-term decline in Idaho's infant mortality has slowed, and perhaps stopped, in the 1980's. In 1986, Idaho's infant death rate rose to 11.3 infant deaths per 1,000 live births. While this increase over the 1985 rate of 10.4 is not statistically significant, it underscores an undesirable change: during the past several decades, Idaho's infant mortality rate had shown a steady decline.

The first part of the study examined overall trends from 1982-1986. The second and most important part of the study focused on possible risk factors and the extent to which higher infant death rates may be tied to these risk factors. Three years (1984-1986) of resident data were combined for Part 2 of the study to obtain an adequate data base. Multiple births were excluded as they present a different risk situation; therefore, all birth and infant death data are based on single live births only. Corresponding birth certificates were matched to the death records for all but four deceased infants. A total of 51,067 single live births were recorded for Idaho residents from 1984 through 1986. During this same period, a total of 489 infants died, resulting in an infant death rate for single live births of 9.6 per 1,000 live births.



RISK FACTOR ANALYSIS

Many of the risk factors are found to be interrelated, e.g., young mothers are more likely to be unmarried or to have less education. Further study may be indicated for some of the risk factors.

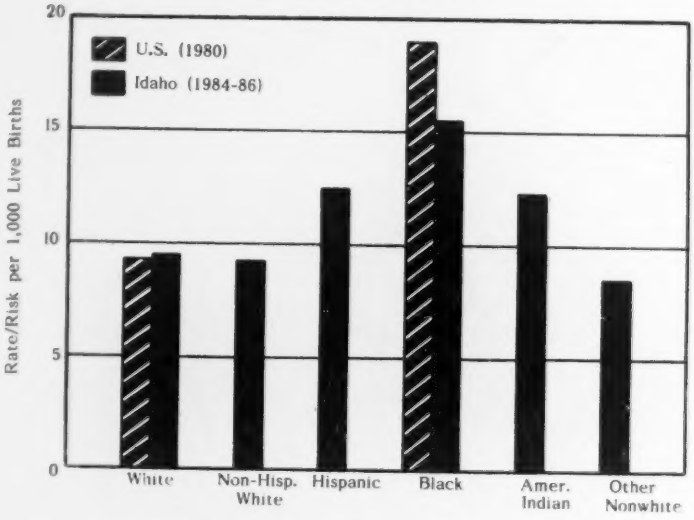
The risk factors studied in Idaho were birth weight, infant's race, maternal age, marital status, education and prenatal care. All were associated with significantly higher infant death rates. The higher overall infant death rates for these risk groups seem associated with a higher incidenc of immature infants (birth weight <2,500 g)

born to mothers in these groups. Only two risk factors were associated with higher weight-specific mortality rates: death rates for infants weighing less than 1,500 g were significantly higher for teen mothers; death rates for infants weighing 1,500+ g were significantly higher when mothers received no prenatal care.

RISK: RACE OF INFANT

"Other nonwhites" (all nonwhites except blacks and American Indians) recorded the lowest Idaho infant death rate (8.5), followed by non-Hispanic whites (9.3), American Indians (12.2), Hispanics (12.5) and blacks (15.6). The numbers in most of the groups were too small to be significant, but considered as a single group, Hispanics, blacks and American Indians recorded a significantly higher infant mortality rate than did non-Hispanic whites. The percent of low birth weight single live births varied among the races: percentages of single live births that were immature were 3.9% of blacks, 4.2% of non-Hispanic whites, 5.4% of Hispanics, 6.7% of "other nonwhites" and 7.3% of American Indians.

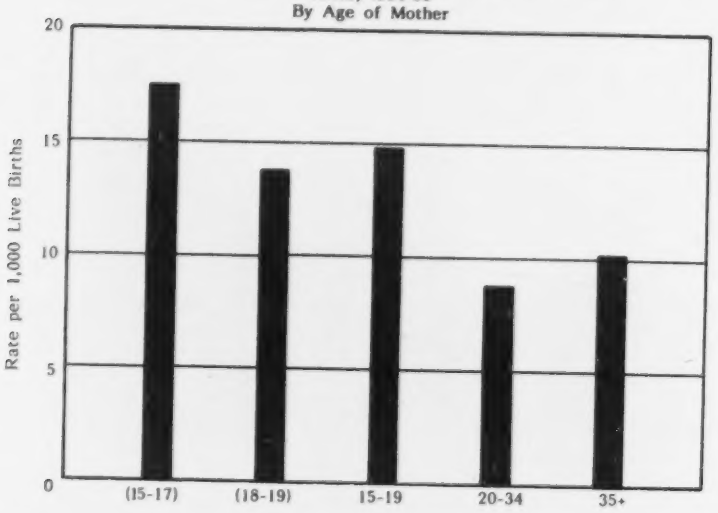
INFANT MORTALITY, SINGLE DELIVERY INFANTS
By Race of Infant



RISK: MOTHER'S AGE

Infant mortality rates varied significantly by maternal age. They were highest for mothers 15-17 years (17.4), followed by 18-19 years (13.7), 35+ years (10.3) and, lastly, 20-35 years (8.7). Among infants weighing less than 1,500 g, teens had a significantly higher rate of death, while the lowest death rates occurred in age group 35+ years. Low birth weight occurred more frequently to teens and women 35+ years. Whether or not the age of the mother is the causative factor, particularly in teens, is not definite. Recent studies indicate that "the offspring of teenagers who receive good prenatal care do not have elevated risk of low birth weight or high mortality."*

INFANT MORTALITY, SINGLE DELIVERY INFANTS
Idaho, 1984-86
By Age of Mother

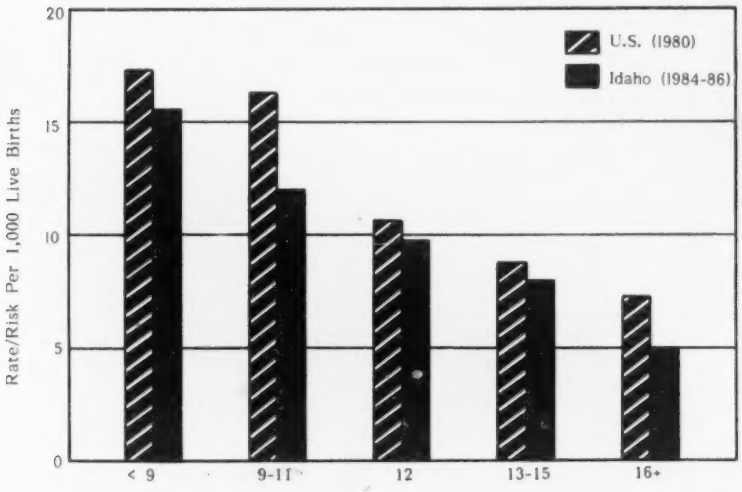


*"Young Maternal Age and Infant Mortality: The Role of Low Birth Weight, "**Public Health Reports**, Vol. 122, No. 2, March-April 1987.

RISK: MOTHER'S EDUCATION

Mother's education is the only socioeconomic indicator appearing on the birth certificate. While not as good an indicator as family income, it is considered to be a reasonably good measure of socioeconomic status. Infant death rates were highest in mothers with the least amount of education, decreasing with increasing years of schooling. Women with less education had a higher percentage of single live births that were immature.

INFANT MORTALITY, SINGLE DELIVERY INFANTS
By Education of Mother

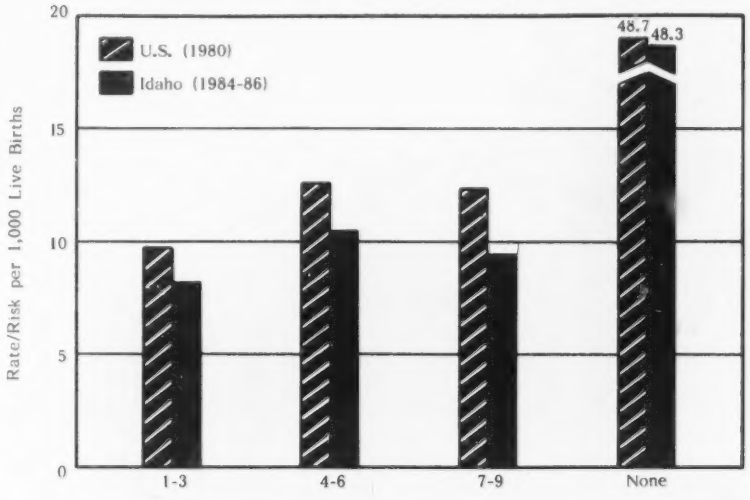


RISK: PRENATAL CARE

Next to low birth weight, lack of prenatal care may be the single most important factor associated with higher infant mortality. The lowest rates occurred when prenatal care was begun in the first trimester. The highest rates occurred in those who received no prenatal care at all: their rates were six times as high as those who received first trimester care.

Not only were mothers with no prenatal care over twice as likely to bear immature infants, but of particular significance is the fact that the mortality rate for babies weighing 1,500+ g whose mothers had no prenatal care was five times as high as the rate for those with early prenatal care.

INFANT MORTALITY, SINGLE DELIVERY INFANTS
By Month Prenatal Care Began



RISK: MARITAL STATUS

Unmarried women were twice as likely to have low birth weight babies, and the resultant infant death rate was 14.3 compared to 9.0 for married women.

INFANT, FETAL AND MATERNAL MORTALITY

The number of Idaho resident infant deaths decreased 15% from 186 in 1986 to 158 in 1987. Coupled with only 3% (498) fewer live births, the infant death rate dropped from 11.3 to 9.9 per 1,000 live births. Considering the size of the data base, such fluctuations are not unexpected, as illustrated by the graph on the following page. However, it appears the trend toward lower rates in evidence over the past decades has stopped. The neonatal death rate decreased from 6.8 in 1986 (the highest rate since 1978) to 5.8 in 1987; the postneonatal death rate was 4.1, the lowest since 1982.

Infant mortality in the U.S. continued to decline, dropping from 10.4 in 1986 to 10.0 in 1987. Neonatal deaths decreased from 6.7 to 6.5; post-neonatal deaths were down from 3.7 to 3.5 (all rates provisional). The difference between U.S. and Idaho infant mortality, once in Idaho's favor, has all but disappeared. (See graph on following page.) Although the composition of the rates varies from year to year, the lower Idaho neonatal death rates normally account for its lower overall infant death rates (except for 1986). Idaho's postneonatal deaths are usually higher than national rates; the higher incidence of SIDS in Idaho appears to account for much of that difference.

All seven districts recorded lower infant mortality in 1987; the highest rate (12.1) was reported by District 3 for the second straight year, while the lowest rate occurred in District 2 (5.9). Neonatal mortality was highest in District 3, postneonatal mortality highest in District 4.

Perinatal mortality declined 19% in 1987 to 10.5; such deaths occurred most frequently to residents of District 3 (13.5), least frequently to District 1 residents (7.9), and declined in all districts except 3 and 7. Stillbirths (a component of perinatal mortality) decreased in 1987 to 6.0 per 1,000 live births. District stillbirth ratios ranged from a high of 7.0 in District 3 to 4.2 in District 5.

There was one Idaho maternal death in 1987, a resident of Payette County (District 3).

760-764, 766, 770-779	Other conditions originating in the perinatal period	33	2.1	31	1.9	2	0.1
798.0	Sudden Infant Death Syndrome	51	3.2	4	0.3	47	3.0
Residual	All other causes	13	0.8	6	0.4	7	0.4

Sudden Infant Death Syndrome (SIDS) was the leading cause of infant deaths in Idaho in 1987. The infant death rate in Idaho from SIDS rose from 2.7 in 1986 to 3.2 deaths per 1,000 live births in 1987. The national SIDS rate declined from 1.4 to 1.2; Idaho's rate is nearly three times as high as the U.S. rate. Districts 3 and 4 recorded the highest SIDS rates in 1987.

The leading cause of neonatal deaths in Idaho was Congenital anomalies (1.8 deaths per 1,000 live births). Although more neonatal deaths occurred in the general category, "Other conditions originating in the perinatal period" (which includes such conditions as complications of pregnancy and delivery, infections, etc.), the second-leading **single** cause was "Disorders relating to short gestation and unspecified low birthweight" (0.8 deaths per 1,000 live births).

In the postneonatal period, SIDS accounted for 71% of the deaths; Idaho's rate of postneonatal deaths from SIDS was 3.0. Congenital anomalies were the second-leading cause of postneonatal mortality with a rate of 0.5.

Note: Changes in procedures for coding SIDS increased the number of deaths attributable to SIDS after 1985; data may not be entirely comparable to previous years.

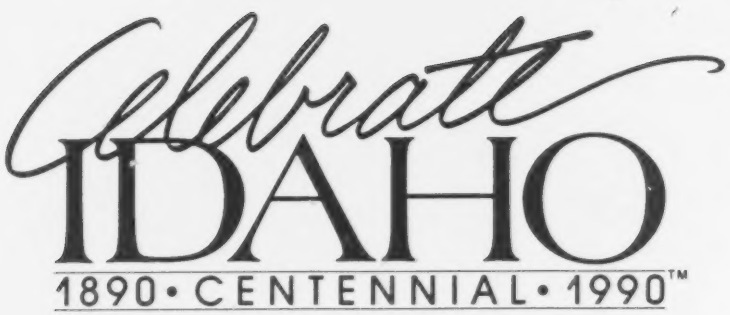
Induced Abortion '87



INDUCED ABORTIONS

In the United States, approximately 1.3 million legal abortions were reported to the Center for Disease Control in 1983 (the latest data available). The abortion ratio (reported abortions per 1,000 live births) decreased from a high of 359/1,000 in 1980 to 358/1,000 in 1981, 354/1,000 in 1982 and 349/1,000 in 1983. In 1983, for the first time since the inception of the CDC surveillance system in 1969, all abortion indicators (the number of abortions, the rate per 1,000 females 15-44, and the ratio to live births) declined.

Comparative U.S. and Idaho abortion data are listed below. Both represent occurrence, not residence, data.

	INDUCED ABORTIONS	RATIO PER 1,000 LIVE BIRTHS	RATE PER 1,000 FEMALES, 15-44
U.S. (1983)*	1,268,987	349	23
Idaho (1987)	1,815	115	8

The reporting of induced abortions in Idaho was not required until July 1, 1977. The reported numbers increased from 708 during the last half of 1977 to a high at 2,706 in 1981. The number of abortions reported in Idaho in 1987 was 1,815, the lowest annual total since reporting began.

No maternal deaths have yet been reported from Idaho induced terminations.

Residence data are also available and presented in this section. These include all Idaho residents who obtained abortions in 1987, regardless of the State of abortion. Tables on pages 72, 73 and 74 reflect residence data; tables on pages 72, 75 and 76 reflect only abortions done in Idaho.

*CDC Surveillance Summaries, Centers for Disease Control, August, 1987.

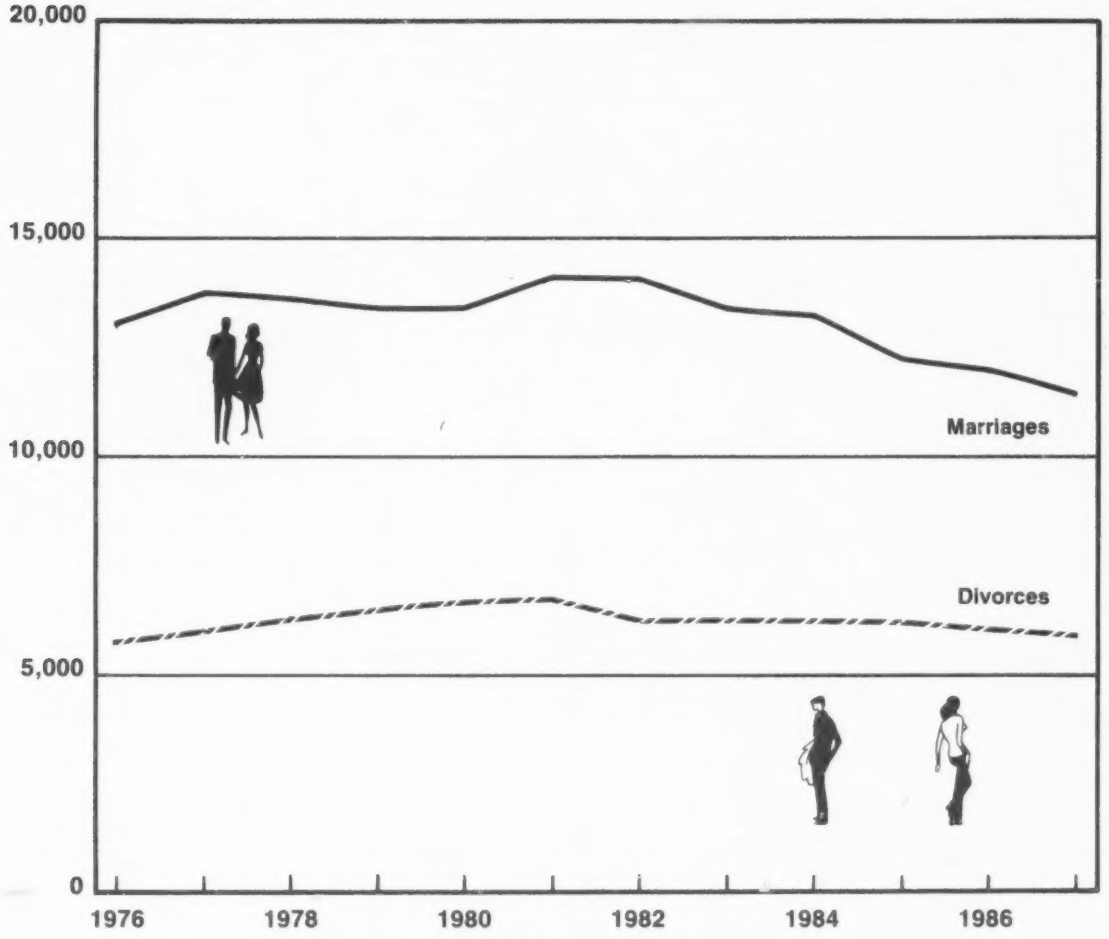
Marriage and Divorce '87

MARRIAGES AND DIVORCES OCCURRING IN IDAHO

1976 - 1987



Both the number and rate of marriages in Idaho decreased again, from 11,957 (11.9) in 1986 to 11,428 (11.5, provisional) in 1987. This decline in the rate is a continuation of the general decline in marriage rates in Idaho; at 11.5, it is the lowest rate since reporting was centralized in 1947. Even so, marriages occur at a higher rate in Idaho than in the U.S. as a whole: the national rate of marriage was 9.9 in 1987 (down slightly from 10.0 in 1986) and is the lowest rate since 1977, when it was also 9.9. The difference between Idaho and the U.S. can, however, be accounted for by the high number of non-residents who marry in north Idaho.

Divorces in Idaho recorded the sixth consecutive numerical decrease in 1987, declining from 6,067 in 1986 to 5,892 in 1987. The 1987 divorce rate dropped to 5.9, the lowest since 1973. Divorces occur less frequently in the remainder of the nation: the U.S. divorce rate remained at 4.8 in 1987, the lowest national divorce rate since 1975.
